(54) Title: **DIPEPTIDE NITRILES**

## (57) Abstract

N-terminal substituted dipeptide nitriles as defined are useful as inhibitors of cysteine cathepsins, e.g. cathepsins B, K, L and S, and can be used for the treatment of cysteine cathepsin dependent diseases and conditions, including inflammation, rheumatoid arthritis, osteoarthritis, osteoporosis, tumors (especially tumor invasion and tumor metastasis), coronary disease, atherosclerosis (including atherosclerotic plaque rupture and destabilization). Particular dipeptide nitriles are compounds of formula (I), or physiologically-acceptable and -cleavable esters or salts thereof, wherein: the symbols are as defined. In particular it has been found that by appropriate choice of groups R, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, X<sub>1</sub>, Y and L, the relative selectivity of the compounds as inhibitors of the various cysteine cathepsin types, e.g. cathepsins B, K, L and S, may be altered, e.g. to obtain inhibitors which selectively inhibit a particular cathepsin type or combination of cathepsin types.

## **DIPEPTIDE NITRILES**

This invention relates to inhibitors of cysteine proteases, in particular to dipeptide nitrile cathepsin inhibitors and to their pharmaceutical use for the treatment or prophylaxis of diseases or medical conditions in which cathepsins are implicated.

The cysteine cathepsins, e.g. cathepsins B, K, L and S, are a class of lysosomal enzymes which are implicated in various disorders including inflammation, rheumatoid arthritis, osteoarthritis, osteoporosis, tumors (especially tumor invasion and tumor metastasis), coronary disease, atherosclerosis (including atherosclerotic plaque rupture and destabilization), autoimmune diseases, respiratory diseases, infectious diseases and immunologically mediated diseases (including transplant rejection).

In accordance with the invention it has been found that dipeptide nitriles are particularly useful as cysteine cathepsin inhibitors and can be used for the treatment of the above-cited cysteine cathepsin dependent conditions.

Accordingly the present invention provides an N-terminal-substituted dipeptide nitrile, i.e. a dipeptide in which the C-terminal carboxy group of the dipeptide is replaced by a nitrile group ( $-C\equiv N$ ) and in which the N-terminal nitrogen atom is substituted via a peptide or pseudopeptide linkage which optionally additionally comprises a -methylene-hetero atom- linker or an additional hetero atom, directly by aryl, lower alkyl, lower alkenyl, lower alkynyl or heterocyclyl, or a physiologically-acceptable and -cleavable ester or a salt thereof, for use as a pharmaceutical.

The invention further provides a pharmaceutical composition comprising an N-terminal-substituted dipeptide nitrile as defined above as an active ingredient.

The invention also provides a method of treating a patient suffering from or susceptible to a disease or medical condition in which a cathepsin is implicated, comprising administering an effective amount of an N-terminal-substituted dipeptide nitrile as defined above to the patient.

The invention further includes the use of an N-terminal-substituted dipeptide nitrile as defined above for the preparation of a medicament for therapeutic or prophylactic treatment of a disease or medical condition in which a cathepsin is implicated.

The dipeptide nitrile of the invention conveniently comprises  $\alpha$ -amino acid residues, including both natural and unnatural  $\alpha$ -amino acid residues. Herein the "natural  $\alpha$ -amino acid residues" denote the 20 amino acids obtainable by translation of RNA according to the genetic code or the corresponding nitriles thereof, as appropriate. "Unnatural  $\alpha$ -amino acid residues" are  $\alpha$ -amino acids which have  $\alpha$ -substituents other than those found in "natural  $\alpha$ -amino acid residues". Preferred  $\alpha$ -amino acid residues, as the C-terminal amino acid residue of the dipeptide nitrile, are the nitriles of tryptophan, 2-benzyloxymethyl-2-amino-acetic acid, 2,2-dimethyl-2-amino-acetic acid, 2-butyl-2-amino-acetic acid, methionine, leucine, lysine, alanine, phenylalanine, and glycine and derivatives thereof, e.g. as hereinafter described. Preferred amino acid residues as the N-terminal amino acid residue of the dipeptide nitrile are 1-amino-cyclohexanecarboxylic acid, 1-amino-cycloheptanecarboxylic acid, phenylalanine, histidine, tryptophan and leucine and derivatives thereof, e.g. as hereinafter described.

The aryl, lower alkyl, lower alkenyl, lower alkynyl or heterocyclyl substituent (hereinafter referred to as R) is attached to the the N-terminal nitrogen atom of the dipeptide via a peptide linkage, i.e. as R-C(O)-NH-, or via a pseudopeptide linkage. Suitable pseudopeptide linkages include sulphur in place of oxygen and sulphur and phosphorous in place of carbon, e.g. as R-C(S)-NH-, R-S(O)-NH-, R-S(O)<sub>2</sub>-NH- or R-P(O)<sub>2</sub>-NH and analogues thereof. Additionally the peptide or pseudopeptide linkage between the R substituent and the N-terminal nitrogen atom may comprise an additional hetero atom, e.g. as R-Het-C(O)-NH-, or a -methylene-hetero atom- linker, e.g. as R-Het-CH<sub>2</sub>-C(O)-NH- or R-CH<sub>2</sub>-Het-C(O)-NH-, wherein Het is a hetero atom selected from O, N or S, and pseudopeptide containing alternatives thereof, e.g. as defined above. When the linkage between the aryl substituent and the N-terminal nitrogen atom comprises a -methylene-hetero atom- linker, the methylene group and the hetero atom may be optionally further substituted, e.g. as hereinafter described.

The R substituent may be further substituted, e.g. by up to 3 substituents selected from halogen, hydroxy, amino, nitro, optionally substituted C<sub>1-4</sub>alkyl (e.g. alkyl substituted by hydroxy, alkyloxy, amino, optionally substituted alkylamino, optionally substituted dialkylamino, aryl or heterocyclyl), C<sub>1-4</sub>alkoxy, C<sub>2-6</sub>alkenyl, CN, trifluoromethyl, trifluoromethoxy, aryl, (e.g. phenyl or phenyl substituted by CN, CF<sub>3</sub>, halogen, OCH<sub>3</sub>), aryloxy, (e.g. phenoxy or phenoxy substituted by CN, CF<sub>3</sub>, halogen, OCH<sub>3</sub>), benzyloxy or a heterocyclic residue.

The compounds of the invention exhibit valuable pharmacological properties in mammals and are particularly useful as cysteine cathepsin inhibitors.

The cathepsin inhibitory effects of the compound of the invention can be determined in vitro by measuring the inhibition of e.g. recombinant human cathepsins B, K, L and S. The buffer used in the cathepsin B, L and S assays is a 0.1 M pH 5.8 phosphate buffer containing EDTA (1.33 mM), DTT (2.7 mM) and Brij (0.03%).

The in vitro assays are carried out as follows:

(a) For cathepsin B:

To a microtiter well is added 100  $\mu$ L of a 20  $\mu$ M solution of inhibitor in assay buffer followed by 50  $\mu$ L of a 6.4 mM solution of Z-Arg-Arg-AMC substrate (Peptides International) in assay buffer. After mixing, 50  $\mu$ L of a 0.544 nM solution of recombinant human cathepsin B in assay buffer is added to the well, yielding a final inhibitor concentration of 10  $\mu$ M. Enzyme activity is determined by measuring fluorescence of the liberated aminomethylcoumarin at 440 nM using 380 nM excitation, at 20 minutes. % Enzyme inhibition is determined by comparison of this activity to that of a solution containing no inhibitor. Compounds are subsequently subjected to a dose response curve analysis to determine  $IC_{50}$  values.

(b) For cathepsin K:

The assay is performed in 96 well microtiter plates at ambient temperature using recombinant human cathepsin K. Inhibition of cathepsin K is assayed at a constant enzyme (0.16 nM) and substrate concentration (54 mM Z-Phe-Arg-MCA - Peptide Institute Inc. Osaka, Japan) in 100 mM sodium phosphate buffer, pH 7.0, containing 2 mM dithiothreitol, 20 mM Tween 80 and 1 mM EDTA. Cathepsin K is preincubated with the inhibitors for 30 min, and the reaction is initiated by the addition of substrate. After 30 min incubation the reaction is stopped by the addition of E-64 (2 mM), and fluorescence intensity is read on a multi-well plate reader at excitation and emission wavelengths of 360 and 460 nm, respectively.

(c) For cathepsin L:

Recombinant human cathepsin L is activated prior to use in this assay: To 500  $\mu$ L of a 510 nM solution of cathepsin L in a 50 mM pH 5.0 acetate buffer containing 1 mM EDTA, 3 mM DTT and 150 mM NaCl is added 10  $\mu$ L of a 625  $\mu$ M solution of dextran sulfate (ave. mw = 8000), and the resulting solution is incubated on ice for 30 min. 4  $\mu$ L of this solution is then diluted into 46  $\mu$ L assay buffer, yielding a 40 nM enzyme solution.

To perform the assay, 100  $\mu$ L of a 20  $\mu$ M solution of inhibitor in assay buffer is added to a microtiter well. 50  $\mu$ L of a 20  $\mu$ M solution of Z-Phe-Arg-AMC (Peptides International) is then added. After mixing, 50  $\mu$ L of the activated 40 nM solution of recombinant human cathepsin L in assay buffer is then added to the well, yielding a final inhibitor concentration of 10  $\mu$ M.

Enzyme activity is determined by measuring fluorescence of the liberated

aminomethylcoumarin at 440 nM using 380 nM excitation of 20 minutes. % Enzyme inhibition is determined by comparison of this activity to that of a solution containing no inhibitor.

Compounds are subsequently subjected to a dose response curve analysis to determine  $IC_{50}$  values.

(d) For cathepsin S:

To a microtiter well is added 100 uL of a 20 uM solution of inhibitor in assay buffer. 50 uL of a 700 uM solution of Z-Val-Val-Arg-AMC substrate (Peptides International) is then added. After mixing, 50 uL of a 5.2 nM solution of recombinant human cathepsin S in assay buffer is then added to the well, yielding a final inhibitor concentration of 10 uM. Enzyme activity is determined by measuring fluorescence of the liberated aminomethylcoumarin at 440 nM using 380 nM excitation at 200 minutes. % Enzyme inhibition is determined by comparison of this activity to that of a solution containing no inhibitor. Compounds are subsequently subjected to a dose response curve analysis to determine  $IC_{50}$  values.

The dosage *in vitro* may range between about  $10^{-5}$  molar and  $10^{-9}$  molar concentrations. The antiarthritic efficacy of the compounds of the invention for the treatment of rheumatoid arthritis can be determined using models such as or similar to the rat model of adjuvant arthritis, as described previously (R.E. Esser, et. al. J. Rheumatology, 1993, 20, 1176.)

The efficacy of the compounds of the invention for the treatment of osteoarthritis can be determined using models such as or similar to the rabbit partial lateral meniscectomy model, as described previously (Colombo et al. Arth. Rheum. 1993 26, 875-886). The efficacy of the compounds in the model can be quantified using histological scoring methods, as described previously (O'Byrne et al. Inflamm Res 1995, 44, S117-S118).

The efficacy of the compounds of the invention for the treatment of osteoporosis can be determined using an animal model such as the ovariectomised rat or other similar species in which test compounds are administered to the animal and the presence of markers of bone resorption are measured in urine or serum (e.g. as described in Osteoporos Int (1997) 7:539-543).

The compounds of the invention are prepared by:

(a) converting an amide of the formula VI

wherein R, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> have meaning as previously defined for the compounds of formula I to a nitrile of formula I; or

(b) condensing a compound of the formula VII

wherein R<sub>4</sub> and R<sub>5</sub> have meaning as defined hereinabove, with an acid of formula VIII

wherein R, R<sub>2</sub> and R<sub>3</sub> have meaning as defined above; or with a reactive derivative thereof; or

(c) condensing a compound of the formula Ia

wherein  $R_2$ ,  $R_3$ ,  $R_4$  and  $R_5$  have meaning as defined hereinabove with an acid corresponding to the group  $R-[L]_x-X_1-$  or with a reactive derivative thereof; and in the above processes, if required, temporarily protecting any interfering reactive groups and then isolating the resulting compound of the invention; and, if desired, converting any resulting compound into another compound of the invention; and/or if desired, converting a resulting compound into a salt or a resulting salt into the free acid or base or into another salt.

Appropriate protecting groups are used for starting compounds and intermediates, for instance as hereinafter described in the Examples.

The conversion of primary amides of formula V to the nitriles of formula I, according to process (a), can be carried out according to methods well known in the art for the dehydration of a primary amide to a nitrile, e.g. with thionyl chloride in the presence of a base. A preferred procedure involves the treatment with oxalyl chloride and pyridine in DMF at or below room temperature as illustrated in the examples.

The starting materials of formula VI can be prepared by condensing an amino acid amide of formula IX

wherein  $R_4$ , and  $R_5$  have meaning as defined above with an acid of the formula VIII, in protected form as appropriate.

The condensation can be carried out according to methods well-known in the art, e.g. by reacting a mixed anhydride or an acyl halide of the acid of formula VIII e.g. the acid chloride, with an amino acid amide of formula IX, in an inert solvent such as methylene chloride, in the presence of a base, such as an amine like triethylamine or pyridine.

The acylation of an acid of formula VIII with an amino acid amide of formula IX can also be carried out in the presence of a condensing agent such as N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide, optionally in the presence of e.g. hydroxybenzotriazole or 1-hydroxy-7-azabenzotriazole, and a base such as N-methylmorpholine.

The amino acid amides of formula IX are either known or can be prepared according to methodology known in the art and illustrated herein.

Alternative procedures and conditions may be used; for instance as described in the Examples.

Compounds of the invention are either obtained in the free form, or as a salt thereof if salt forming groups are present.

Acidic Compounds of the Invention may be converted into metal salts with pharmaceutically acceptable bases, e.g. an aqueous alkali metal hydroxide, advantageously in the presence of an ethereal or alcoholic solvent, such as a lower alkanol. Resulting salts may be converted into the free compounds by treatment with acids. These or other salts can also be used for purification of the compounds obtained. Ammonium salts are obtained by reaction with the appropriate amine, e.g. diethylamine, and the like.

Compounds of the Invention having basic groups can be converted into acid addition salts, especially pharmaceutically acceptable salts. These are formed, for example, with inorganic acids, such as mineral acids, for example sulfuric acid, a phosphoric or hydrohalic acid, or with organic carboxylic acids, such as (C<sub>1</sub>-C<sub>4</sub>)alkanecarboxylic acids which, for example, are unsubstituted or substituted by halogen, for example acetic acid, such as saturated or unsaturated dicarboxylic acids, for example oxalic, succinic, maleic or fumaric acid, such as hydroxycarboxylic acids, for example glycolic, lactic, malic, tartaric or citric acid, such as amino acids, for example aspartic or glutamic acid, or with organic sulfonic acids, such as (C<sub>1</sub>-C<sub>4</sub>)-alkylsulfonic acids (for example methanesulfonic acid) or arylsulfonic acids which are unsubstituted or substituted (for example by halogen).

Preferred are salts formed with hydrochloric acid, methanesulfonic acid and maleic acid.

In view of the close relationship between the free compounds and the compounds in the form of their salts, whenever a compound is referred to in this context, a corresponding salt is also intended, provided such is possible or appropriate under the circumstances.

The compounds, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization.

The pharmaceutical compositions according to the invention are those suitable for enteral, such as oral or rectal, transdermal, topical, and parenteral administration to mammals, including man, to inhibit cathepsin activity, and for the treatment of cathepsin dependent disorders, in particular inflammation, osteoporosis, rheumatoid arthritis and osteoarthritis, and comprise an effective amount

of a pharmacologically active compound of the invention, alone or in combination, with one or more pharmaceutically acceptable carriers.

More particularly, the pharmaceutical compositions comprise an effective cathepsin inhibiting amount of a Compound of the Invention.

The pharmacologically active Compounds of the Invention are useful in the manufacture of pharmaceutical compositions comprising an effective amount thereof in conjunction or admixture with excipients or carriers suitable for either enteral or parenteral application. Preferred are tablets and gelatin capsules comprising the active ingredient together with a) diluents, e.g. lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine; b) lubricants, e.g. silica, talcum, stearic acid, its magnesium or calcium salt and/or polyethyleneglycol; for tablets also c) binders e.g. magnesium aluminum silicate, starch paste, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and or polyvinylpyrrolidone; if desired d) disintegrants, e.g. starches, agar, alginic acid or its sodium salt, or effervescent mixtures; and/or e) absorbents, colorants, flavors and sweeteners. Injectable compositions are preferably aqueous isotonic solutions or suspensions, and suppositories are advantageously prepared from fatty emulsions or suspensions. Said compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable substances. Said compositions are prepared according to conventional mixing, granulating or coating methods, respectively, and contain about 0.1 to 75%, preferably about 1 to 50%, of the active ingredient.

Tablets may be either film coated or enteric coated according to methods known in the art.

Suitable formulations for transdermal application include an effective amount of a compound of the invention with carrier. Advantageous carriers include absorbable pharmacologically acceptable solvents to assist passage through the skin of the host. For example, transdermal devices are in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound of the skin of the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the device to the skin. Matrix transdermal formulations may also be used.

Suitable formulations for topical application, e.g. to the skin and eyes, are preferably aqueous solutions, ointments, creams or gels well-known in the art. Such may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives.

The pharmaceutical formulations contain an effective cathepsin inhibiting amount of a Compound of the Invention as defined above, either alone or in combination with another therapeutic agent.

In conjunction with another active ingredient, a Compound of the Invention may be administered either simultaneously, before or after the other active ingredient, either separately by the same or different route of administration or together in the same pharmaceutical formulation. The dosage of active compound administered is dependent on the species of warm-blooded animal (mammal), the body weight, age and individual condition, and on the form of administration. A unit dosage for oral administration to a mammal of about 50 to 70 kg may contain between about 5 and 500 mg of the active ingredient.

The present invention also relates to methods of using Compounds of the Invention and their pharmaceutically acceptable salts, or pharmaceutical compositions thereof, in mammals for inhibiting cathepsins, such as cathepsin B, K, L and/or S, and for the treatment of cathepsin dependent conditions, such as cathepsin B, K, L and/or S dependent conditions, described herein, e.g. inflammation, osteoporosis, rheumatoid arthritis and osteoarthritis.

Particularly the present invention relates to a method of selectively inhibiting cathepsin activity in a mammal which comprises administering to a mammal in need thereof an effective cathepsin inhibiting amount of a Compound of the Invention.

More specifically such relates to a method of treating rheumatoid arthritis, osteoarthritis, and inflammation (and other diseases as identified above) in mammals comprises administering to a mammal in need thereof a correspondingly effective amount of a Compound of the Invention.

The following examples are intended to illustrate the invention and are not to be construed as being limitations thereon. Temperatures are given in degrees Centigrade. If not mentioned otherwise, all evaporations are performed under reduced pressure, preferably between about 15 and 100 mm Hg (= 20-133 mbar). The structure of final products, intermediates and starting materials is confirmed by standard analytical methods, e.g. microanalysis and spectroscopic characteristics (e.g. MS, IR, NMR). Abbreviations used are those conventional in the art.

A white powder with mp. 100-103°C,  $R_f=0.36$  ( $\text{CH}_2\text{Cl}_2/\text{MeOH}=9:1$ ) is obtained.

By repeating the procedure described above in Example 74, using appropriate starting materials and conditions the following compounds of formula XIV are obtained as identified below in Table 4.

Example 78     [1-(2-Benzyloxy-1-cyano-ethylcarbamoyl)-3-methyl-butyl]-carbamic acid benzyl ester

A.     3-Benzyloxy-2-(2-benzyloxycarbonylamino-4-methyl-pentanoylamino)-propionic acid

To a suspension of 0.975 g H-Ser(OBzl)-OH in 5 ml of methylene chloride is added 1.52 ml of trimethylchlorosilane. After ten minutes at room temperature 0.98 ml of N,N-diisopropylethyl amine and 1.81 g of benzyloxy leucine N-hydroxysuccinimide is added. The reaction mixture is stirred for 2 hours at room temperature and diluted with ethyl acetate. Ethyl acetate is washed once with saturated  $\text{NH}_4\text{Cl}$ -solution and once with  $\text{H}_2\text{O}$ , then dried over sodium sulfate, the solvent is removed and the residue is crystallized from diethylether.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ , ppm): 7.30 (m, 10H), 6.83 (d, 1H), 5.32 (d, 1H), 5.10 (s, 2H), 4.71 (m, 1H), 4.50 (s, 2H), 4.28 (m, 1H), 3.92 (m, 1H), 3.67 (m, 1H), 1.46 - 1.79 (m, 3H), 0.92 (d, 6H).

Compounds of Examples 1 to 153 are typically selective inhibitors of cathepsin K and generally have  $IC_{50}$ s for inhibition of human cathepsin K of from about 100 to about 1 nM or less, e.g. about 0.5nM.

Representative compounds e.g. as described in the the above Examples typically have  $IC_{50}$ s for inhibition of Cathepsin K in the range from less than 1 up to about 100 nM, and  $IC_{50}$ s for inhibition of Cathepsin K which are at least 10 to about 1000 times less than their  $IC_{50}$ s for inhibition of Cathepsin L and Cathepsin S, e.g. when tested in the assays described above.

The cathepsin K selective compounds of the invention are particularly indicated for preventing or treating osteoporosis of various genesis (e.g. juvenile, menopausal, post-menopausal, post-traumatic, caused by old age or by cortico-steroid therapy or inactivity).

The compounds of Table 10 are inhibitors of cathepsin L and cathepsin S, having IC<sub>50</sub>s for inhibition of cathepsin L in the range from about 100 to about 50 nM and IC<sub>50</sub>s for inhibition of cathepsin S in the range from about 50 to about 10 nM.

**Example 302 Synthesis of N-[2-[(3-(methoxy-carbonyl)-phenyl)-methoxy]-1(S)-cyanoethyl]-3-methyl-N $\alpha$ -(2,2-diphenylacetyl)-L-phenyl-alaninamide**

**A. O-[[3-(methoxycarbonyl)-phenyl]methyl]-N-(t-butoxycarbonyl)-L-serine**

To a solution of N-(t-butoxycarbonyl)-L-serine (16.1 g, 78.46 mmol) in DMF (90 mL) at -15°C is added sodium hydride (6.9 g, 60% in mineral oil, 172.6 mmol) portionwise with vigorous stirring, over 0.5 hour. After all sodium hydride is added, the mixture is stirred for an additional 10 minutes at 0°C, and then at room temperature for 30 minutes. The solution is cooled back to 0°C, and a solution of methyl 3-bromomethylbenzoate (19.77 g, 86.30 mmol) in DMF (90 mL) is added dropwise over 15 minutes. The mixture is then warmed to room temperature for 16 hours. DMF is then evaporated (high vacuum, <40°C), and the residue is diluted with cold water (200 mL) and acidified to pH 4-5 with 1 N HCl. The resulting mixture is extracted with EtOAc (4 x 150 mL). The combined extracts are washed with 0.1 N HCl (2 x 300 mL) and brine (2 x 300 mL), dried over MgSO<sub>4</sub>, and evaporated to give a yellowish syrup. Chromatography (silica, 5% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) yields O-[[3-(methoxycarbonyl)-phenyl]methyl]-N-(t-butoxycarbonyl)-L-serine as a yellowish oil.

**B. O-[[3-(methoxycarbonyl)phenyl]methyl]-N-(t-butoxycarbonyl)-L-serinamide**

A solution of O-[[3-(methoxycarbonyl)phenyl]methyl]-N-(t-butoxycarbonyl)-L-serine (3.0 g, 8.50 mmol) and N-methylmorpholine (2.8 mL, 2.58 g, 25.5 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (50 mL) is cooled to -10°C, and isobutyl chloroformate (1.1 mL, 1.16 g, 8.5 mmol) is added dropwise over 10 minutes.

After stirring for 15 minutes, ammonia gas is bubbled into the solution at a moderately vigorous rate for 15 minutes.
